A comprehensive introduction to the structure, properties, and applications of materials This title provides the first unified treatment for the broad subject of materials. Authors Gersten and Smith use a fundamental approach to define the structure and properties of a wide range of solids on the basis of the local chemical bonding and atomic order present in the material. Emphasizing the physical and chemical origins of material properties, the book focuses on the most technologically important materials being utilized and developed by scientists and engineers. Appropriate for use in advanced materials courses, The Physics and Chemistry of Materials provides the background information necessary to assimilate the current academic and patent literature on materials and their applications. Problem sets, illustrations, and helpful tables complete this well-rounded new treatment. Five sections cover these important topics: * Structure of materials, including crystal structure, bonding in solids, diffraction and the reciprocal lattice, and order and disorder in solids * Physical properties of materials, including electrical, thermal, optical, magnetic, and mechanical properties * Classes of materials, including semiconductors, superconductors, magnetic materials, and optical materials in addition to metals, ceramics, polymers, dielectrics, and ferroelectrics * A section on surfaces, thin films, interfaces, and multilayers discusses the effects of spatial discontinuities in the physical and chemical structure of materials * A section on synthesis and processing examines the effects of synthesis on the structure and properties of various materials This book is enhanced by a Web-based supplement that offers advanced material together with an entire electronic chapter on the characterization of materials. The Physics and Chemistry of Materials is a complete introduction to the structure and properties of materials for students and an excellent reference for scientists and engineers.

Reconstruction of ocean paleoproductivity and paleochemistry is paramount to understanding global biogeochemical cycles such as the carbon, oxygen and sulfur cycles and the responses of these cycles to changes in climate and tectonics. Paleo-reconstruction involves the application of various tracers that record seawater compositions, which in turn may be used to infer oceanic processes. Several important tracers are incorporated into pelagic barite, an authigenic mineral that forms in the water column. Here we summarize the utility of pelagic barite for the reconstruction of export production and as a recorder of seawater S, O, Sr, Ca and Ba.

A guide to the elements discusses their discovery and properties and how they have shaped technology and civilization.

Marine Pollution: Functional Responses presents the proceedings of the symposium, ""Pollution and Physiology of Marine Organisms,"" held on November 14-17, 1977, at Hobcaw Barony in Georgetown, South Carolina. It explores the effects of pollutants, such as petroleum hydrocarbons, heavy metals, pesticides, and polychlorinated biphenyls (PCBs), on marine organisms ranging from pink salmon fry to sculpins, estuarine fishes and crabs, bivalve mollusks, lugworms, and oysters. Comprised of four parts encompassing 22 chapters, this volume begins with an overview of the fate and effects of petroleum hydrocarbons on marine biota. It proceeds with a discussion of the hydrocarbon metabolic system in polychaetes and their role in the degradation of hydrocarbons in sediments; the effects of aromatic hydrocarbon toxicants on breathing rates of pink salmon fry; and biological and toxicological effects of heavy metals and other cations on marine species. The book also describes the impact of PCBs and pesticides on the estuarine environment, and how more specialized and less persistent chemicals affect the development and reproduction of nontarget organisms such as Crustacea. This book will be a valuable resource for marine scientists, ecologists, and students.
